Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

OfficeAction27049@oliff.com
jarnstrong@oliff.com

Office Action Summary

Application No.

10/531,577

Applicant(s)

NORO ET AL.

Examiner

Kirsten C. Jolley

Art Unit

1715

Period for Reply -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 08 October 2010.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 20, 21, 23-25, 27, 28 and 32-40 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 20, 21, 23-25, 27, 28 and 32-40 is/are rejected.
- 7) ☒ Claim(s) 32 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☒ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-946)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

Response to Arguments

1. Applicant's arguments filed October 8, 2010 have been fully considered but they are not persuasive.

Applicant states that it appears that the Office action asserts that the upper pallet 1a of Fukuta corresponds to the cam of claim 20, and that the lower pallet 1b of Fukuta corresponds to the pedestal of claim 20. The Examiner acknowledges that this is correct.

Applicant states that Fukuta discloses that the upper inward longitudinal end portion of the doctor blade 30 follows the outer peripheral surface of the upper pallet 1a to maintain a constant distance between the doctor blade 30 and the outer peripheral surface of the columnar structural body of Fukuta, however Fukuta is silent regard the relationship between the lower inward longitudinal end portion of the doctor blade 30 and the outer peripheral surface of the lower pallet 1b. Applicant argues that it seems unlikely that the lower inward longitudinal end portion of the doctor blade 30 overlaps or follows the outer peripheral surface of the lower pallet 1b because the alignment of the doctor blade 30 with the columnar structural body can be performed solely by aligning the doctor blade 30 with the upper pallet 1a. Applicant additionally argues that Fukuta merely discloses that the doctor blade 30 of Fukuta follows the upper pallet 1a, which does not necessarily mean that the upper inward longitudinal end portion of the doctor blade 30 contacts the upper pallet 1a. This is not convincing because Fukuta teaches "In this case, the upper and lower end portions of the doctor plate 30 are contacted with the upper pallet 1b [sic] and the lower pallet 1b, respectively [emphasis added]" (col. 7, lines 58-61). Thus

Fukuta explicitly states that the doctor blade 30 contacts the upper pallet (cam) and lower pallet (pedestal). As further evidence, Fukuta teaches in col. 8, lines 7-10 that "The diameter of the outer peripheral surface of each of the upper and lower pallets 1a, 1b is the same as that of the outer peripheral surface of a final coated honeycomb structural body." The contact with upper and lower pallets would inherently inhibit an omission of coating an upper end and a lower end of the outer peripheral surface of the pillar structure and prevent uncoated portions.

Applicant additionally argues that Gane is fixedly connected to the supporting member 6 and does not contact an outer periphery of the web of paper 1. However, the Examiner notes that the flexible blade of Gane would merely be substituted for the doctor blade 30 of Fukuta, and the structure taught by Fukuta (including contact of the blade at both upper and lower pallets) would be maintained in the combination of Fukuta et al. taken in view of Gane.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 20-21, 23-25, 27-28, and 33-40 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fukuta et al. (US 5,749,970) in view of Gane (US 4,728,539).

Fukuta et al. discloses an apparatus for coating the outer peripheral surface of a pillar structure comprising: a holder which holds the pillar structure in nearly vertical direction and

rotates together with the held pillar structure on an axis of nearly vertical direction as a common rotating axis, wherein the holder holds the pillar structure placed thereon with one end thereof facing downward and has a pedestal rotating together with the held pillar structure on the axis of the substantially vertical direction as the common rotating axis (col. 8, lines 14-19); a supplying and coating mechanism which supplies a coating material to the outer peripheral surface of the rotating pillar structure and coats the coating material on the outer peripheral surface; a doctor blade smoothing means the one longer side end portion of which is disposed at a given position with respect to the outer peripheral surface and which smoothes the coating surface of the coating material supplied to and coated on the outer peripheral surface; and a following mechanism comprising first and second following rollers 36, 37 which drives the smoother following the outer periphery of the pedestal/pallet so that the smoother is disposed at a given position with respect to the outer peripheral surface of the pillar structure (col. 4, line 57 to col. 5, line 18); whereby the coating material is supplied to and coated on the outer peripheral surface through the doctor blade, the coating material is delivered by a nozzle from the supplying and coating mechanism to the outer peripheral surface of the pillar structure, and the coating surface is smoothed between the outer peripheral surface and the doctor blade.

Fukuta et al. lacks a teaching of a smoother having a smoothing plate and a sheet-like elastic body provided at the longer side end portion of the smoothing plate on the side of the pillar structure. The prior art of Gane is cited for its teaching of a coating apparatus comprising a flexible/elastic blade secured to a retaining means. Gane teaches that the flexible blade of its invention achieves improved coating such as a much smoother flow of coating composition under the blade as compared to a prior art steel doctor blade, resulting in a smooth, level coating

(col. 3, line 52 to col. 4, line 14, and col. 2, lines 7-45). It would have been obvious to one having ordinary skill in the art, having seen the improved results achieved by Gane, to have substituted a flexible/elastic doctor blade in the apparatus of Fukuta et al. with the expectation of achieving smoother flow of coating material under the blade and a resulting smooth, level coating.

With respect to the newly added limitation requiring that the upper end portion of the elastic body contacts the outer periphery of the cam and a lower end portion of the elastic body contacts the outer periphery of the pedestal at a time of supplying the coating material, Fukuta teaches “the upper and lower end portions of the doctor plate 30 are contacted with the upper pallet 1b [sic] and the lower pallet 1b, respectively [emphasis added]” (col. 7, lines 58-61). Thus Fukuta explicitly states that the doctor blade 30 contacts the upper pallet (cam) and lower pallet (pedestal). As further evidence, Fukuta teaches in col. 8, lines 7-10 that “The diameter of the outer peripheral surface of each of the upper and lower pallets 1a, 1b is the same as that of the outer peripheral surface of a final coated honeycomb structural body.” The contact with upper and lower pallets would inherently inhibit an omission of coating an upper end and a lower end of the outer peripheral surface of the pillar structure and prevent uncoated portions.

With respect to claim 21, the doctor blade of Fukuta et al. is disposed so that its longer direction coincides with the central axis direction of the pillar structure, therefore the modified elastic blade would be disposed in the same position. The elastic blade would contact the outer peripheral surface of the pillar structure, as similarly illustrated in Gane, between both end faces of the pillar structure.

As to claim 23, Fukuta et al. teaches that the holder has a cam which is disposed on the side of another end of the pillar structure placed and held on the pedestal and rotates on the axis of the vertical direction as the common rotating axis (col. 7, lines 24-36). As to claim 24, the outer peripheral shape of the pedestal and that of the cam are nearly the same. As to claim 25, a centering means holds the pillar structure and the pedestal and/or the cam in a given positional relation.

As to claim 27, the following mechanism has first and second following rollers 36, 37 which are disposed at a given distance from each other and move backward and forward following the outer periphery of the cam while contacting with the outer periphery of the cam together with the supplying and coating mechanism and the smoother, and the first and second following rollers are disposed so that the angle formed by a straight line passing through the centers of the respective rollers and a tip portion of the smoother is a given angle (see Figure 4).

As to claim 28, Fukuta et al. teaches third and fourth following rollers where the rotating axis of the third following roller and that of the first following roller are common and the rotating axis of the fourth following roller and that of the second following roller are common in col. 5, lines 19-28.

As to claim 33, Gane teaches that the elastic blade may comprise rubber (col. 3, lines 18-19).

As to claim 34, Fukuta et al. teaches that the outer periphery of the pedestal and/or the cam comprise stainless steel or ceramics (col. 5, lines 34-40).

As to claim 35, Fukuta et al. discloses that its original doctor blade should be made of stainless steel or ceramics to provide durability (col. 5, lines 29-31). For this reason, it would have been obvious for the retaining means of the flexible blade in the apparatus of Fukuta et al. in view of Gane to similarly be made of stainless steel or ceramics -- to provide durability.

As to claim 36, the shape of a section of the pillar structure cut along a plane perpendicular to the central axis of the pillar structure is circular or elliptical (see Figures).

As to claim 37, Fukuta et al. teaches that its pillar structure is a honeycomb structure comprising a plurality of cells which are flow paths for fluid.

As to claim 38, Fukuta et al. lacks a disclosure of supplying and coating mechanism and smoother which can rotate together along the outer periphery of the pillar structure. However it is the Examiner's position that it would have been obvious for an engineer having ordinary skill in the art to have reversed the means for relative movement (i.e., the pillar structure is stationary while the coating and smoothing mechanism rotate around the pillar structure) with the expectation of equivalent and similar results since relative movement between the substrate and coating and smoothing mechanism is what is required.

As to claim 39, Fukuta et al. also discloses a method of using the apparatus discussed above with respect to claim 20 comprising: holding the pillar structure by the holder; supplying the coating material from the supplying and coating mechanism on the outer peripheral surface of the pillar structure and coating the coating material thereon while rotating the pillar structure and the holder on the axis of vertical direction as a common rotating axis; and smoothing the

coating surface of the supplied and coated coating material between the outer peripheral surface and the sheet-like elastic body.

As to claim 40, Fukuta et al. illustrates in Figure 4 and 5a-b that first and second following rollers 36, 37 are positioned on substantially the same horizontal plane against the outer peripheral surface.

Allowable Subject Matter

4. Claim 32 would be allowable if rewritten to include all of the limitations of the base claim and any intervening claims.

Conclusion

5. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kirsten C. Jolley whose telephone number is 571-272-1421. The examiner can normally be reached on Monday to Tuesday and Thursday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Timothy Meeks can be reached on 571-272-1423. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
